End of Life for H2scan Models 1600 and 1700

H2scan is committed to supporting our customers by delivering more cost effective but higher performing products. A key outcome of that effort has been the introduction of our intrinsically safe 5th generation (model 5330 and 5320 series) of hydrogen sensor products. These models provide significant improvements in performance for legacy and future safety and process hydrogen measurement needs.

With the intrinsically safe product launch, and based on the increasing difficulty in sourcing components, the HY-ALERTA 1600 and HY-OPTIMA 1700 series products will be discontinued with immediate effect. We have retained spares, and to the extent that we have and can source components, we will continue to support our installed based for the foreseeable future.
